

ChemTAG's DEMO 2000 project: *Improved reservoir management by use of environment-friendly, DNA-based tracers*

DNA-based tracers:

- Are synthetically produced molecules with encoded information.
- Give potential access to a large number of tracer molecules due to DNA coding.
- Do not need individual qualification tests since the information contents does not affect chemical, physical or biological properties. Reduced unit costs allows more intensive use.
- Concentrations by use of the Polymerase Chain Reaction.
- Has no known negative effects on the environment or on living species.
